STAFF MO

Preconditioassigned to one branch.

Postconditi he account stays authenticated until the daily session expires or the employee logs out.

No.	Acceptance Criteria (System Requirements)
ST-01	1. The Login screen shows a “Username” field, a “Password” field with a Show/Hide control, and a “Log In” button; no other staff function can be opened before authentication. 2. Tapping the Show/Hide control reveals the typed password and tapping it again masks it; the password is masked by default. 3. If the Username is blank, the inline error “Please enter your username.” appears under the field; if the Password is blank, “Please enter your password.” appears under that field; no login request is sent while a required field is empty. 4. When both fields are filled and “Log In” is tapped, a loading screen (a spinner with the text “Logging in…”) covers the form, the fields and the button are disabled so the request cannot be sent twice, and the screen closes as soon as the system responds. 5. If the system does not respond within 10 seconds or there is no internet connection, the loading screen closes and the message “Unable to connect. Please check your internet connection and try again.” is shown; the entries are kept and “Log In” is enabled again. 6. If no account matches the Username, the error “Username not found. Please check your username.” is shown under the Username field; no session is created and the Password field is cleared. 7. If the Username exists but the Password does not match, the error “Incorrect password. Please try again.” is shown under the Password field; no session is created, the Password field is cleared, and the Username is kept. 8. If the owner has deactivated the account, login is refused even when the password is correct and the message “This account is inactive. Please contact the owner.” is shown; no session is created. 9. If the credentials are valid, the message “Login successful.” is shown briefly, the system creates a secure session that starts the employee’s daily login session for the current business day, and retrieves the branch assigned to the account. 10. For the whole session, every sales, inventory, and history request returns only records of the assigned branch; records of other branches cannot be opened. 11. After authentication, the POS screen is displayed as the main screen with the branch name and the employee’s name in the top bar and an empty current order. 12. Passwords are handled by the system’s authentication service and are never stored or displayed as plain text, except while Show is active. 13. At the start of each business day, the employee must log in again; no staff function opens without a valid daily session, and the previous day’s session is never reused. 14. If the employee closes the application and reopens it (or the device restarts) during the same business day, the session is restored and the POS screen opens without asking for the credentials; a restored session still returns only the records of the assigned branch. 15. The session expires automatically at the end of the defined business day (cut-off time), whether the application is open or closed; if it is open, the Login screen is shown with the message “Your session for the business day has ended. Please log in again.” and an order that was not confirmed is not recorded as a sale. 16. The employee may log out manually at any time (see Staff Profile and Logout); a manual logout ends the daily session immediately, and after expiry or logout the Back button or reopening the application shows no protected screen or branch data. 17. Inactivity lock (additional security measure, enabled once the group finalizes the timeout setting): after no activity for the configured timeout, a lock screen hides the branch data; unlocking requires the employee’s password, and a wrong password shows “Incorrect password. Please try again.” while the screen stays locked. 18. A correct password returns to the same screen with the current order intact; the inactivity lock never ends or restarts the daily session by itself.

No.	Acceptance Criteria (System Requirements)
ST-02	1. The POS is the main screen: a grid of selectable product buttons, each showing the product name, selling price, and Available/Unavailable status, with the order panel and total always visible at the bottom. 2. A single tap on an available product adds one unit to the current order and a second tap increases its quantity; selecting a product only adds it to the order and records no sale. 3. Each order line shows product, quantity, and line amount with controls to increase or decrease the quantity (minimum 1) and to remove the line; the order total recalculates immediately after every change. 4. Tapping an unavailable product does not add it and shows a message that the item is currently unavailable. 5. With an empty order, “Proceed to Payment” is blocked and the message “Please add at least one item to the order.” is shown. 6. On the payment step the staff member selects the payment method and enters the payment details required by it; if no method is selected or the required details are missing or invalid, the step is blocked with an inline error. 7. The review screen shows the items, quantities, total, and payment details with “Confirm Transaction” and “Cancel Order”; on confirm the system re-checks that the order is not empty and every product is still available, otherwise the sale is blocked and the staff member is returned to the order. 8. On a valid confirm, the system saves the sale (branch, employee account, date and time, items, quantities, prices, total, payment details) with a unique transaction reference. While the record is being saved, a loading indicator with the text “Saving…” is shown and the buttons are disabled so the record is created only once; if saving fails or the connection is lost, the indicator stops, “Unable to save. Please check your internet connection and try again.” is shown with a “Retry” button, and the entries are kept. 9. A confirmation screen shows the transaction reference, total, and payment details with a “Generate Receipt” button (see Generate Receipt) and a “New Order” button that starts an empty order; the Back button cannot reopen the confirmed transaction. 10. “Cancel Order” asks for confirmation and then clears the order without saving a sale or using a transaction reference; if saving fails, an error with “Retry” is shown and a retry reuses the same reference.

No.	**Acceptance Criteria (System Requirements)**

STAFF MO

ST-11	1. The count screen is a dedicated inventory section opened from the navigation, with a searchable list of the assigned branch’s items. 2. After an item is selected, the screen shows the item name, unit of measurement, and its expected quantity (read-only). 3. The “Actual Count” field accepts a number of zero or greater, based on counting, weighing, or measuring, with the unit shown; a blank, negative, or non-numeric entry blocks submission with an inline error. 4. As the actual count is typed, the screen shows the difference (actual minus expected) and a result tag: “Matches expected”, “Lower than expected”, or “Higher than expected”. 5. “Save as Draft” saves the entered actual count with the status Draft; a draft creates no discrepancy, does not change the expected inventory, and is visible only in this count section. 6. A draft, or a count that has not yet been submitted, can be reopened and edited freely (the Actual Count can be changed) until it is submitted. 7. “Submit Count” is enabled only for a valid entry and asks for confirmation that a submitted count can afterward be changed only through a correction request; on confirm it saves a physical inventory record with the status Submitted (item, expected quantity, actual quantity, difference, branch, date and time, employee account), and the button is disabled while saving. 8. While the record is being saved, a loading indicator with the text “Saving…” is shown and the buttons are disabled so the record is created only once; if saving fails or the connection is lost, the indicator stops, “Unable to save. Please check your internet connection and try again.” is shown with a “Retry” button, and the entries are kept. 9. After submission, the count cannot be edited directly; a submitted count that has not been validated shows a “Request Correction” action that asks for the revised actual count and a required reason and sends the request to the owner, while the original count stays unchanged until the owner approves it. 10. When the owner approves a correction, the count shows the revised value and the system retains the original value, revised value, editor (employee account), reason, date, and time as a revision history viewable in the count details; when the owner rejects it, the original count stays and the staff member is told the correction was rejected. 11. Once the owner has validated the count and authorized the adjustment, the count shows the status Validated, is locked, and can no longer be edited or corrected directly; any further change requires a new count. 12. If the count matches, a confirmation is shown and the screen returns to the item list. 13. If the count is lower or higher, the discrepancy screen of Inventory Reporting opens for the staff member. 14. The count is preserved in Transaction History as a Physical Inventory Count together with its revision history.

ST-13	1. The report opens from the Inventory Reporting list with a back arrow, the title “Total Ingredient Quantity Report”, the branch name, and the date and time it reflects. 2. A table lists every ingredient of the assigned branch with its total expected quantity and unit of measurement. 3. Prepared batter appears as a row in bottles. 4. Rows are sorted by ingredient name and the table scrolls horizontally if the width is exceeded. 5. The quantities equal the expected quantities shown in Branch Inventory at the same moment. 6. The report is read-only and shows only the assigned branch. 7. If no inventory records exist, “No records to display.” is shown. 8. While the data is loading, a loading indicator is shown; if loading fails, “Unable to load data. Please check your internet connection and try again.” is shown with a “Retry” button.

STAFF MO

ST-14	1. The report opens with the title “Ingredient Category Summary Report”, the branch name, and the date and time it reflects. 2. Ingredients are grouped under category headers (e.g., meat, dry goods, condiments) as assigned by the owner. 3. Each category header shows the number of ingredients it contains. 4. Under each header, every ingredient is listed with its expected quantity and unit of measurement. 5. A combined quantity is shown for a category only for ingredients that share the same unit of measurement; quantities with different units are never added together. 6. Categories are listed alphabetically and collapse or expand when the header is tapped. 7. The report is read-only, shows only the assigned branch, and shows “No records to display.” when no ingredients exist. 8. While the data is loading, a loading indicator is shown; if loading fails, “Unable to load data. Please check your internet connection and try again.” is shown with a “Retry” button.

STAFF MO

ST-15	1. The report opens with the title “Ingredient Stock Status Report”, the branch name, and the date and time it reflects. 2. A table lists each ingredient with its expected quantity, unit of measurement, minimum stock level, and a status tag. 3. The status is “Normal” when the expected quantity is above the minimum stock level. 4. The status is “Low Stock” when the expected quantity has reached or fallen below the minimum stock level and is above 0. 5. The status is “Out of Stock” when the expected quantity is 0. 6. Each status has its own color and label so meaning does not depend on color alone. 7. The report is read-only, shows only the assigned branch, and shows “No records to display.” when no ingredients exist. 8. While the data is loading, a loading indicator is shown; if loading fails, “Unable to load data. Please check your internet connection and try again.” is shown with a “Retry” button.

ST-17	1. The report opens with the title “Inventory Discrepancy Report”, the branch name, and the date and time it reflects. 2. Each row shows the item, expected quantity, actual quantity, difference, branch, date and time, submitting employee account, staff remarks, and review status. 3. The difference carries a sign and color (shortage and excess are visually distinct). 4. Review status shows Pending Review or Adjusted according to the owner’s action. 5. Rows are sorted with the newest first. 6. Records are read-only and the report shows only the assigned branch. 7. When an approved correction changes the actual quantity, the row shows the revised actual quantity and the original value stays in the count’s revision history. 8. If no discrepancy exists, “No records to display.” is shown. 9. While the data is loading, a loading indicator is shown; if loading fails, “Unable to load data. Please check your internet connection and try again.” is shown with a “Retry” button.

STAFF MO

ST-19	1. “Inventory Transaction History” opens from the navigation with a transaction type filter and a date filter. 2. The type filter offers All, Stock-In, Sales Consumption, Waste, Spillage, Physical Inventory Count, and Authorized Adjustment. 3. The date filter accepts a single date or a date range selected with a date picker and works together with the type filter. 4. Records are listed newest first; each row shows a type tag, item, signed quantity with unit, and date and time. 5. Each transaction type has its own tag so records of different types are never mixed. 6. Tapping a row opens the record details: reference, type, item, quantity, reason or remarks where applicable, date and time, the employee account that recorded it, and, for a Physical Inventory Count, its revision history. 7. Only records of the assigned branch are returned. 8. If no record matches the filters, “No transactions found.” is shown. 9. Records are read-only; staff cannot edit or delete them (a count can be changed only through the correction request in Override Inventory Count). 10. While the data is loading, a loading indicator is shown; if loading fails, “Unable to load data. Please check your internet connection and try again.” is shown with a “Retry” button.
